

Growers' comments:

“The advantage of the Evaposensor system over time based systems, is that it automatically takes care of changing weather conditions and reflects what is going on around the cuttings. After installing two Evaposensors to control our mist system under glass, the advantages gained encouraged us to install a further six for propagation in polytunnels.”

John Hedger, Managing Director, New Place Nurseries

“We have been very pleased by the simplicity of management of the device. The user interface is friendly and easy to understand ... The Evaposensor beds continue to perform at their optimum without regular manual intervention, therefore at weekends and spring and autumn periods when weather can rapidly change we are not using valuable skilled staff time in making regular tweaks to the system which are sometimes missed.”

Charles Carr, Nursery Manager, Lowaters Nursery

“It has been an easy system to adapt to and change from the conventional ‘wet leaf’ system. Very quickly I found I could leave the sensor to totally control the misting, the beds did not become too wet or too dry making a very good rooting environment ... I am very keen to have the entire mist house at Boningale changed to the Evapo-mist system.”

Nerys Arch, Propagation Manager, Boningale Nursery

“This system is brilliant; the ‘guesstimation’ in irrigation is completely done away with and it has made an enormous improvement in our use of water. Saves water, time, effort and money, cuts out guess work and over watering. Matching irrigation to the water lost by the plant has been a goal for us for over 20 years; now at last we can do it!”

Bill Godfrey, Managing Director, W. Godfrey & Sons
